

Blink Clicking without Cursor Movement *Quick Glance v. 4.5*

Overview

This mode enables the user to perform mouse clicks using eye blinks without moving the cursor according to the user's eye gaze. The cursor does not follow the user's gaze, but can be moved by the hardware mouse.

Detailed Instructions

- Create a user and calibrate the system with a standard 16 point calibration.
- Navigate to "Setup>Select Clicking Options" and check the box next to "Allow Blink Click without Moving Cursor".
- Return to the opening screen. Check the box "Enable Blink Click" to allow blink clicking without gaze tracking.
- Note that in this mode it doesn't matter which user is active since the calibration is not used.
